

Study Management System Big User Stories

Our project aims to assist those who not only need help with things such as organising their tasks efficiently, boosting productivity, and encouraging consistent studying habits. This application will consist of features such as a study management priority list, various productivity booster features, and user persistence features.

1. Study Management and Priority List:

This feature originated from the main requirement of our customer which was to be able to visualise and set their tasks in one place. Users can create new tasks and organise them according to their priority and after these tasks are completed, users are able to click a checkbox beside it which will mark it as completed. This functionality ensures that users will be able to complete their tasks as efficiently as possible thus leading to more effective time studying.

2. Productivity Booster Features:

This user story revolves around helping users increase their productivity through features designed to increase focus and motivation while studying. These features aim to help users while studying to stay on task to increase their effective studying without getting distracted or moving off track.

3. User Persistence:

Our last key aspect in the Study Management System and our final big user story comes from our customer having issues with studying consistently. This feature aims to track user progress and use that information to encourage consistent studying habits. By using this information we can add features that reward users based on their studying activity and visualise it for them to persist in using the app ultimately leading to more consistent studying and better habits.
